SAFETY PRECAUTION

Many electrical and mechanical parts in this chassis have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the protection afforded by them cannot necessarily be assured by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this manual. Electrical components having such features are identified by a  in the schematic diagram and the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitute replacement parts which do not have the same safety characteristics are specified in the parts list may create shock, fire or other hazards.

SPECIFICATIONS

• MW RADIO

Frequency Range	515-1630 kHz
Intermediate Frequency	465±1 kHz (OPTION)
Usable Sensitivity	58 dB (Output 50mW)
S/N Ratio	35 dB
I.F. Rejection Ratio	30 dB
10% T.H.D. Power Output	1500 mW (DC) 1300 mW (AC)
T.H.D.	4%
Frequency Response	100-2,000 Hz (74 dB Input)

• FM RADIO

Frequency Range	87.35-108.25 MHz
Intermediate Frequency	10.7±0.1 MHz (OPTION)
Usable Sensitivity	20 dB
S/N Ratio	45 dB
I.F. Rejection Ratio	50 dB
Automatic Frequency Control	400-800 kHz
10% T.H.D. Power Output	1500/1300 mW (DC/AC)
T.H.D.	3%
Frequency Response	0±4 dB
Stereo Separation	20 dB
Stereo T.H.D.	7%

• SW RADIO

Frequency Range	5.7-18.5 MHz
Intermediate Frequency	465±1 kHz (OPTION)
Usable Sensitivity	45 dB (400 Hz, 30% Mod.)
S/N Ratio	35 dB
Maximum Sensitivity	40 dB
Image Rejection	5 dB (At Max Sens)

• TAPE RECORDER

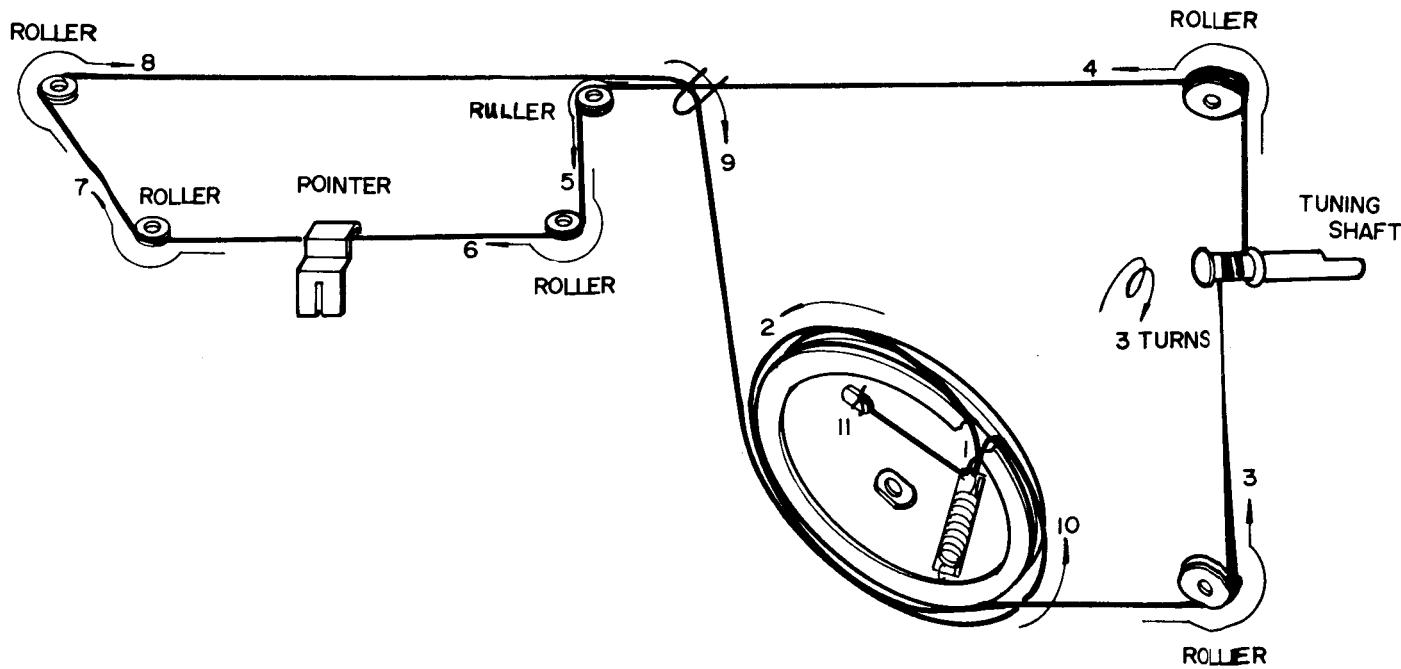

Tape Speed	4.75 cm/sec
Wow & Flutter	0.35% (JIS WRMS)
Frequency Response	±6 dB
Distortion	4% (PLAY), 8% (REC/PLAY)
10% T.H.D. Output	1500/1300 mW
S/N Ratio	40 dB (PLAY), 30 dB (REC/PLAY)
Erase Ratio	40 dB

• GENERAL

Circuit System	4 Track 2 Channel Stereo
Speaker	Woofer (3.5") 4 ohm × 2 Tweeter piezo × 2
Power Source	DC: 9V ("D" cell × 6) AC: 220V/50Hz
Antenna	FM/SW; Telescopic Rod Antenna MW: Ferrite Bar Antenna

DIAL CORD STRINGING

1. Referring to figure 8, loop the dial cord in the direction of arrows.
2. Dial pointer on scale plate is in low position.

**Figure 1.**

Set the tuning capacitor to minimum frequency and string the cord following the numbers in figure 1.

ADJUSTMENT

- EQUIPMENT NEEDED

1. AM Signal Generator
2. FM Signal Generator
3. IF Sweep Generator with marker Capabilities
4. FM Stereo Signal Generator
5. Oscilloscope
6. Output Meter (SSVM)
7. FM MPX Signal Generator
8. Frequency Counter
9. Nonmetallic Alignment Tools

- IMPORTANT

1. Check power-source voltage.
2. Set the function switch to band being aligned.
3. Turn volume control to minimum unless otherwise noted.
4. Connect low side of signal source and output indicator to chassis ground unless otherwise specified.
5. Keep the signal input as low as possible to avoid AGC and AFC action.
6. Standard modulation is 1000 Hz at 30% for AM. (1000 Hz at 22.5 kHz deviation for FM)

- LOCATION OF ADJUSTMENT POINTS

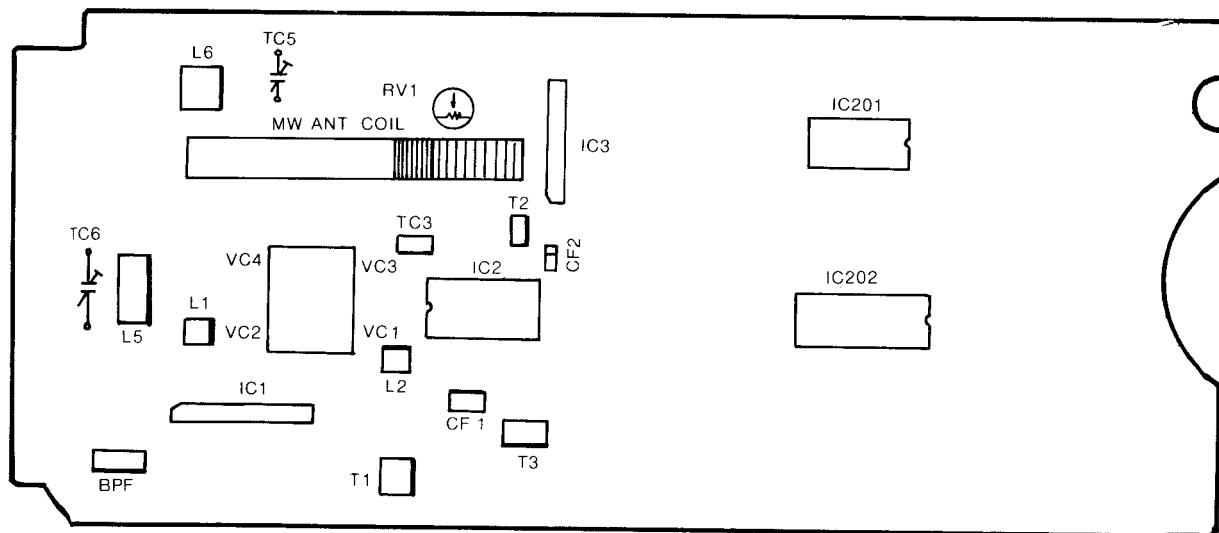

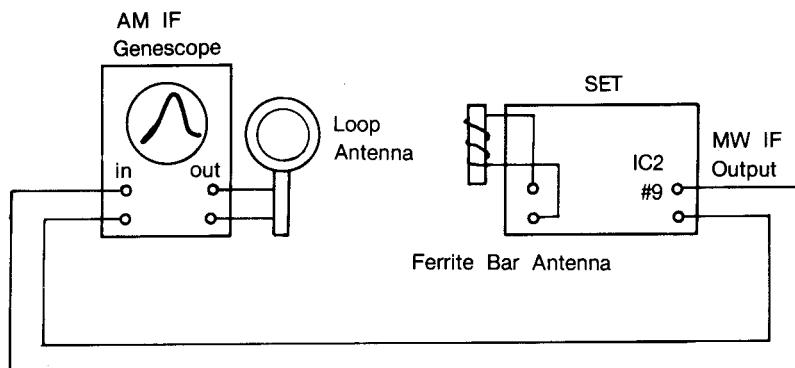

Figure 2. P.C. BOARD

• **MW IF ADJUSTMENT**

IF Genescope The input connects to Pin No. 9 of IC2 and the output connects to the MW antenna coil (L3) through loop antenna.

Adjust for the IF wave form of genescope to be maximum.

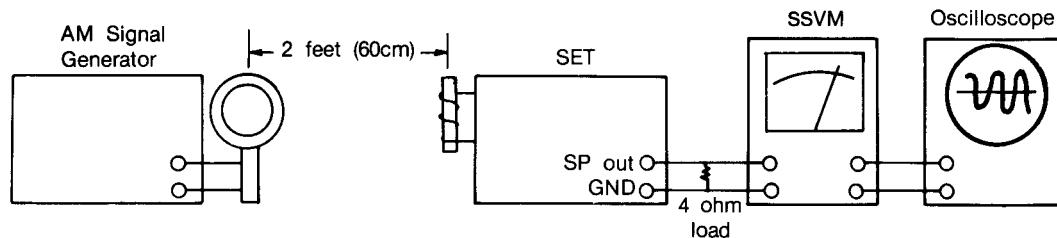

Sequent	Dial pointer position	Genescope output (kHz)	Adjustment
1	Highest frequency	465	T2
		Repeat step several times.	

• **MW RF ADJUSTMENT**

Signal Generator Connects to MW antenna coil (L3) through loop antenna.
Adjust for the indication of SSVM or the wave form of scope to be maximum.

Sequent	Dial pointer position	SG output (kHz)	Adjustment
1	Lowest frequency	515	L4
2	Highest frequency	1630	TC3
3	Repeat Steps 1 and 2 several times.		
4	600 kHz	600	L3
5	1400 kHz	1400	TC4
6	Repeat steps 4 and 5 several times.		

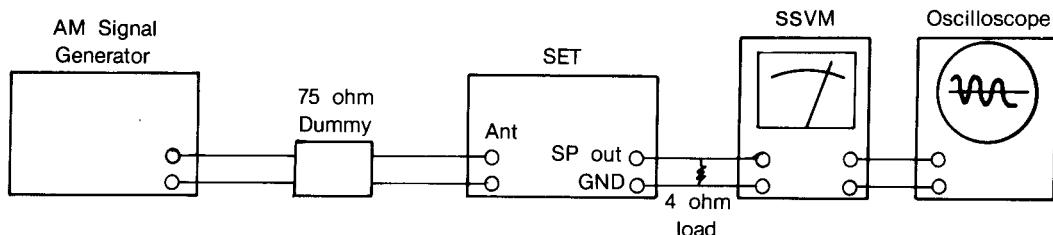

• SW RF ADJUSTMENT

Signal Generator AM Signal generator to antenna terminals through SW dummy matching network.

Adjust for the indication of SSVM or the wave form of scope to be maximum.

Sequent	Dial pointer position	SG output (MHz)	Adjustment
1	Lowest frequency	5.7	L6
2	Highest frequency	18.5	TC6
3	Repeat steps 1 and 2 several times.		
4	6.5 MHz	6.5	L5
5	18.5 MHz	18.5	TC5
6	Repeat steps 4 and 5 several times.		

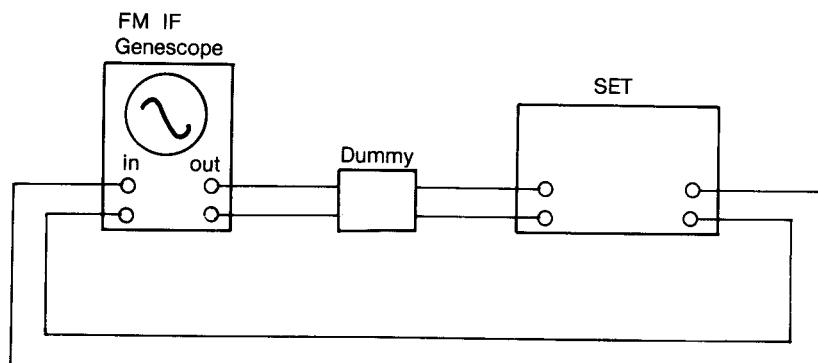

• FM IF ADJUSTMENT

IF Genescope The input connects to Pin No. 8 of IC2 and the output connects to body IC1 through dummy.

Adjust so that the wave form for appeared on genescope may be the best linear s-curve.

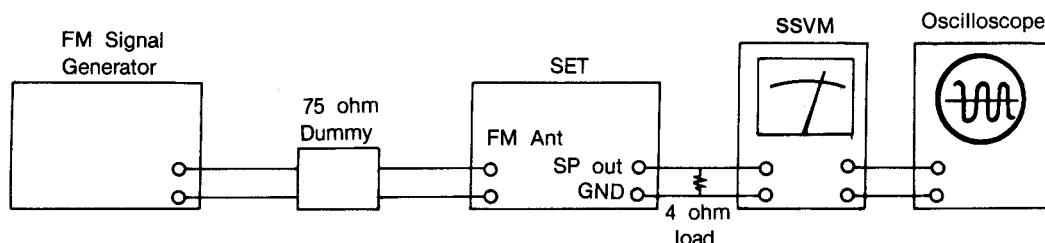

Sequent	Dial pointer position	SG output (MHz)	Adjustment
1	Highest frequency	10.7	T3
2	Highest frequency	10.7	T1
3	Repeat steps 1 and 2 several times.		

- **FM RF ADJUSTMENT**

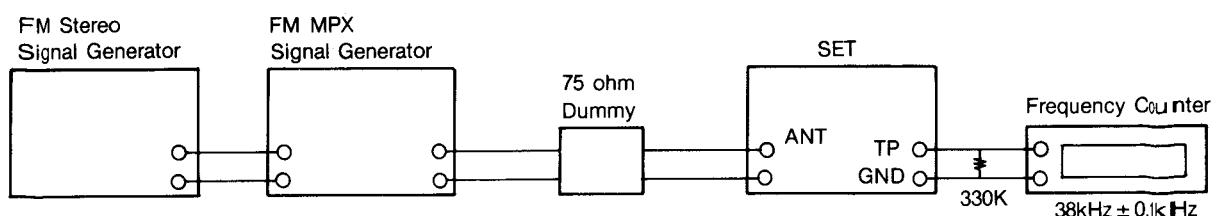

Signal Generator Connect to FM antenna through dummy.
 Adjust for the indication of SSVM or the wave form of scope to be maximum.

Sequent	Dial point position	SG output (MHz)	Adjustment
1	Lowest frequency	87.35	L2
2	Highest frequency	108.25	TC1
3	Repeat steps 1 and 2 several times.		
4	90 MHz	90	L1
5	106 MHz	106	TC2
6	Repeat steps 1 and 2 several times.		

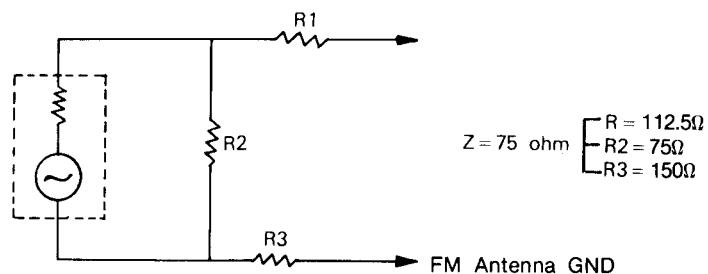

- **FM MPX ADJUSTMENT**

Frequency counter Connect to pin No. 6 of IC3.
 Adjust RV1 so that the indication of frequency counter may be $38 \text{ kHz} \pm 0.1 \text{ kHz}$.

NOTE: FM DUMMY ANTENNA

Z = Output impedance to Signal Generator

STANDARD MAINTENANCE

- TAPE HEAD AND CAPSTAN CLEANING

Whenever a unit is brought in for service or repair, clean the tape heads, capstan drive shaft and other tape handling surfaces to ensure proper tape handling and optimum frequency response. Use a cotton swab dipped in head cleaner or denatured alcohol to clean all tape handling surfaces. Wipe dry.

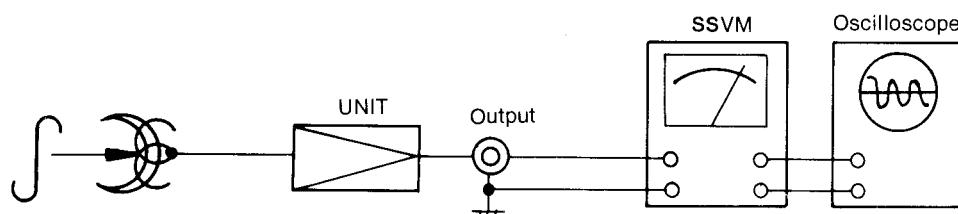

- TAPE HEAD DEMAGNETIZATION

Do not use magnetized tools near the tape heads, since they can magnetize the head. After long period of the heads will retain a small amount of residual magnetism. A magnetized head will result in loss of high frequency response and increased noise. Use a standard tape head demagnetizer and follow the instructions supplied with it to demagnetize the heads.

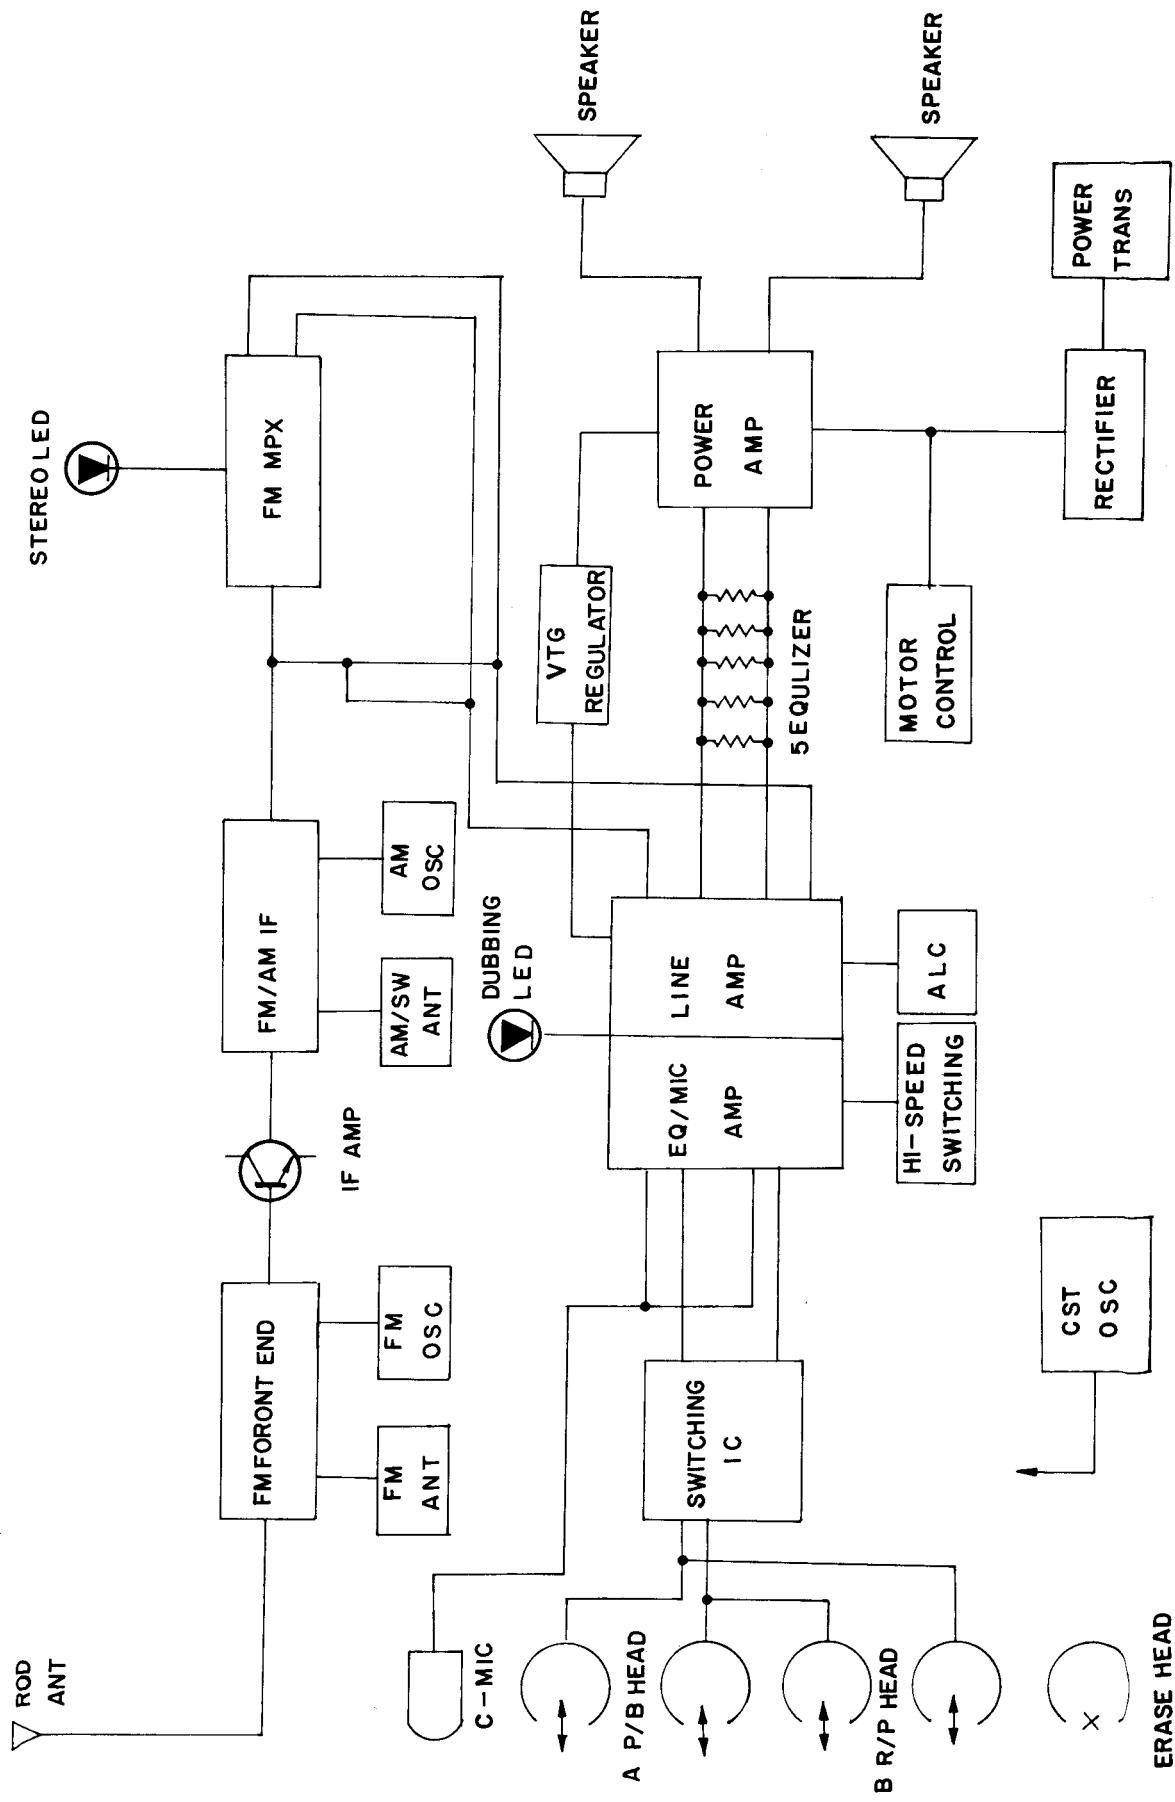

- AZIMUTH ADJUSTMENT

1. Azimuth adjustment is normally required when the head is replaced, or for cases of cross-talk and poor high frequency response. A test tape is required for such adjustment.
2. Connect a oscilloscope or SSVM to the right channel output. Insert a test tape into the unit (Use a test tape such as TEAC MTT-113N). Adjust the azimuth adjustment screw for maximum output onto the right channel.

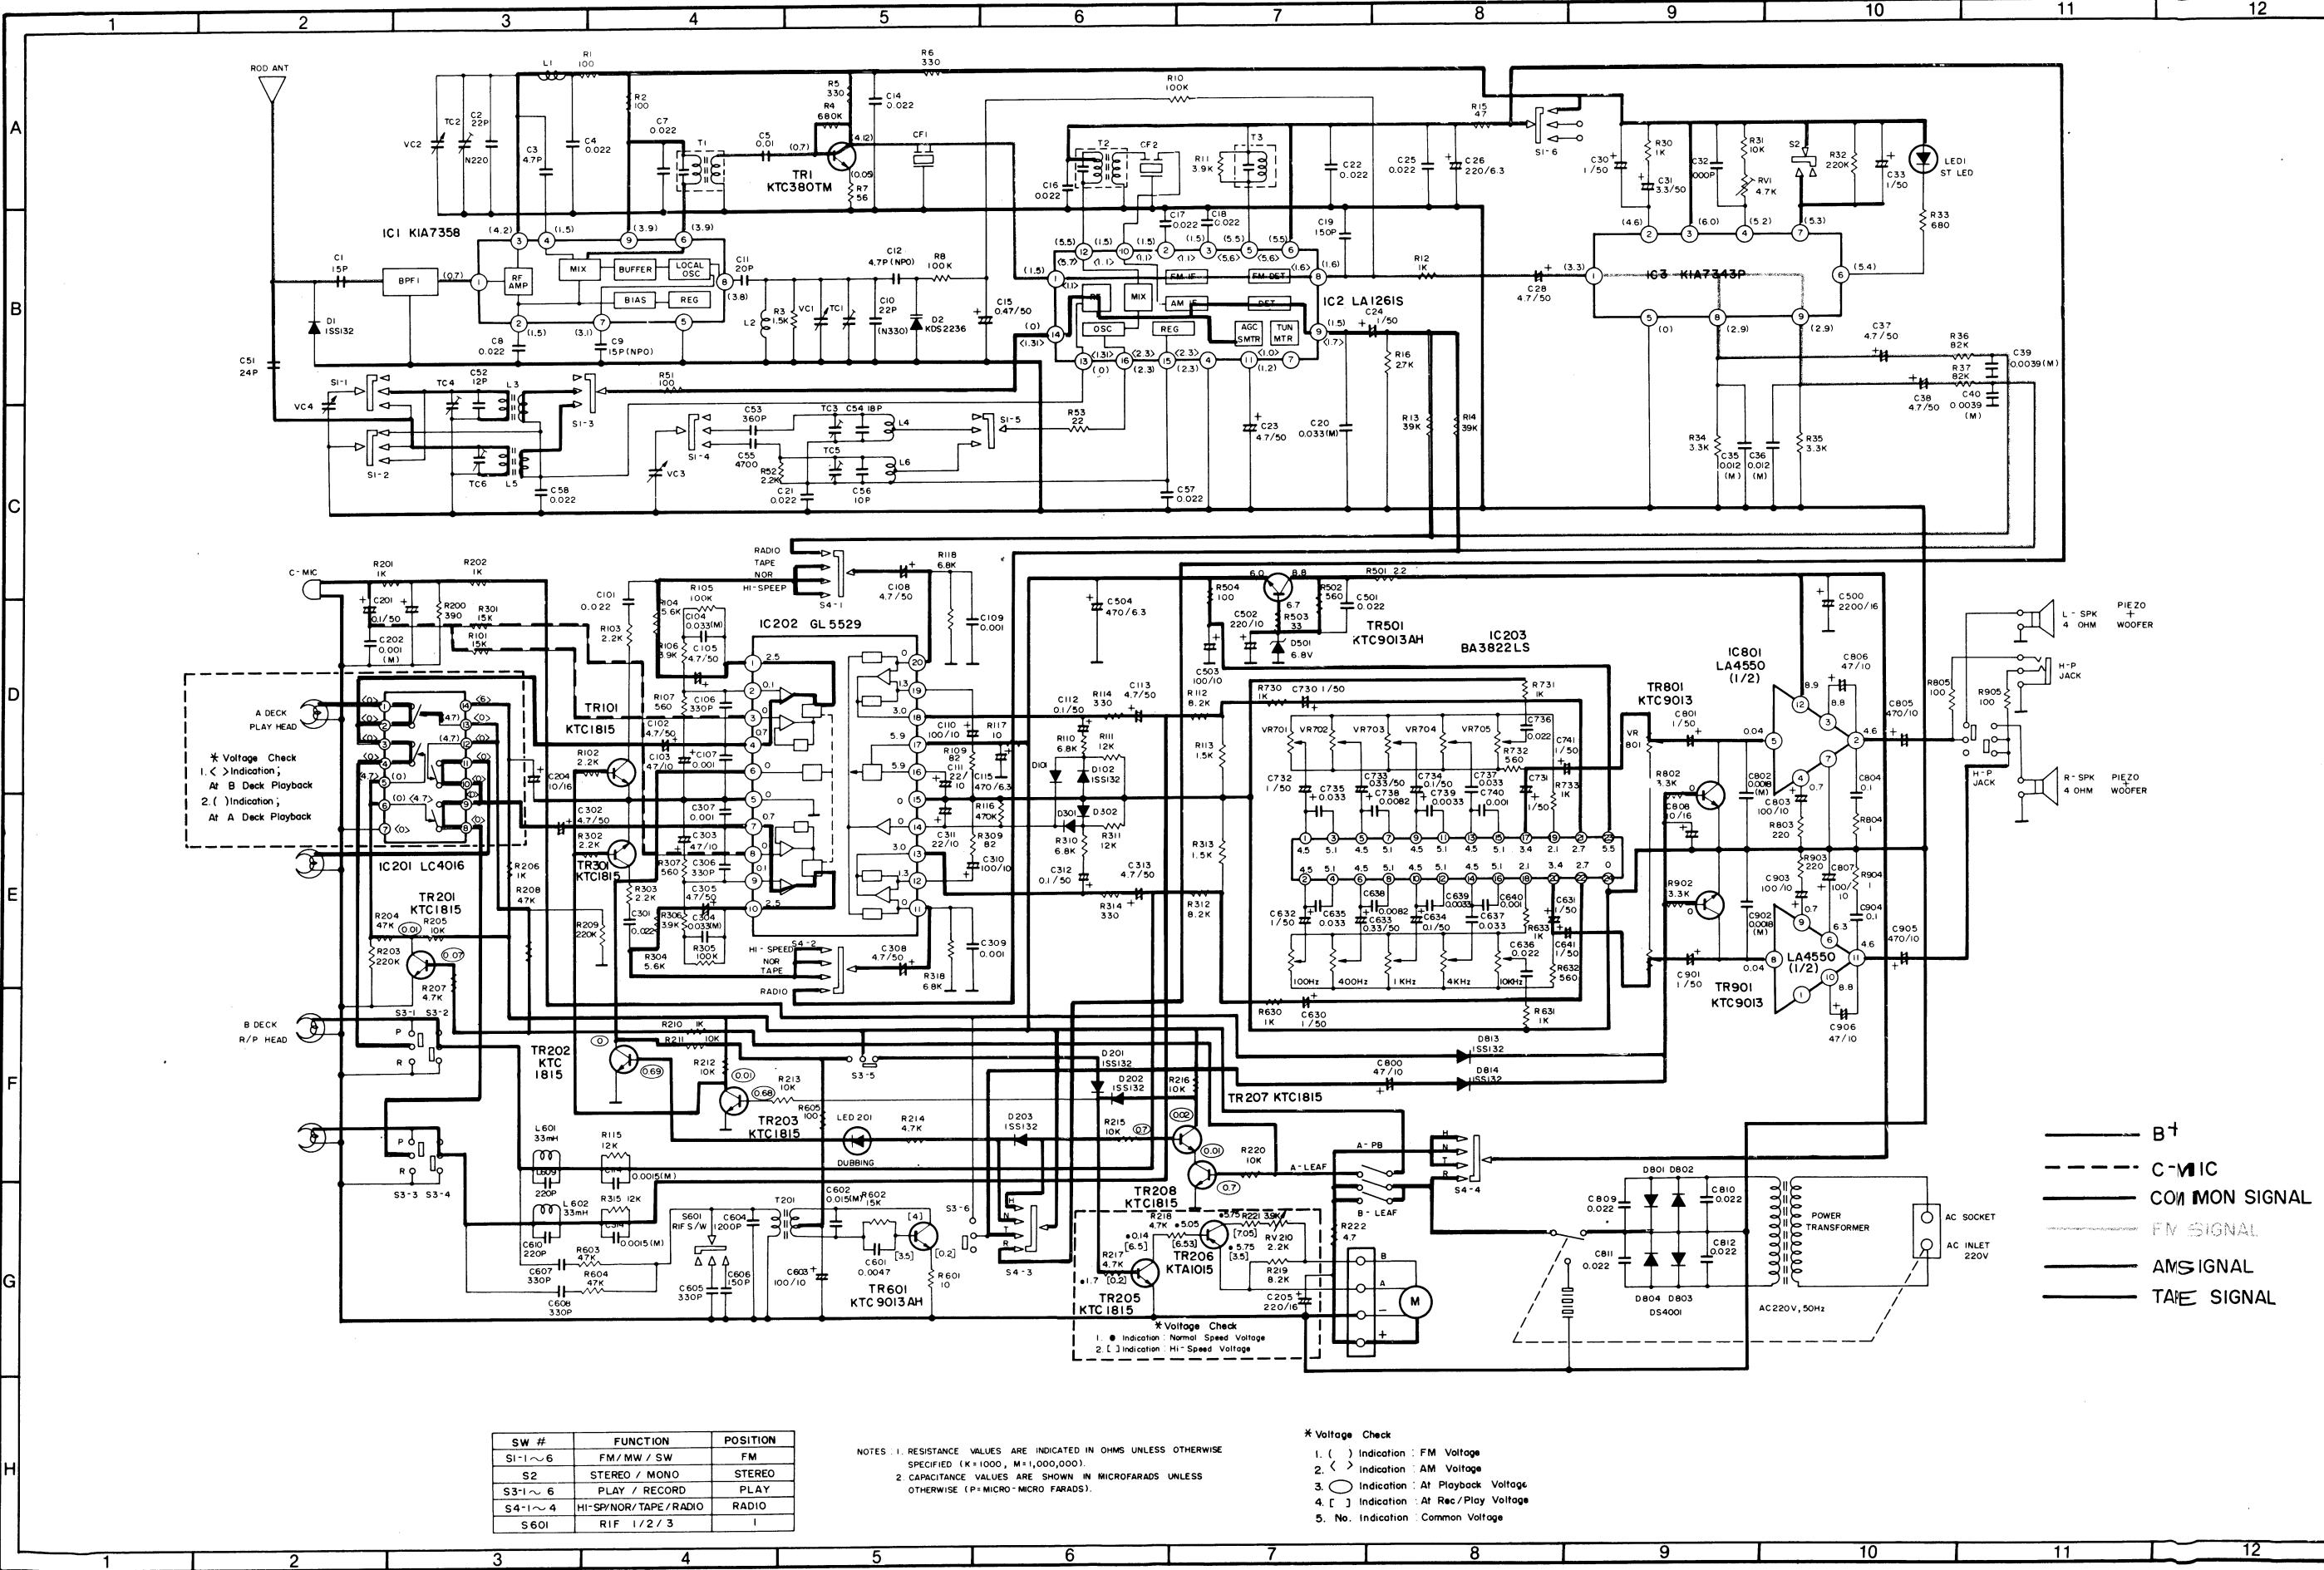

Use glyptal or other non-hardening cement to lock the azimuth adjustment screw.
